Protect Your Family with hepatitis B vaccines

Doctors and scientists recommend hepatitis B vaccines for everyone

Regardless of their medical history or lifestyle.

Hepatitis B can cause irreversible liver damage and liver cancer.

The virus can lead to serious health issues without symptoms. You can still spread it to others even if you don’t feel sick.

Hepatitis B vaccines protect against liver disease and liver cancer for the rest of your life.

You need two or three shots to be fully protected against hepatitis B. Ask your doctor how many shots you need.
